SEISMIC EVALUATION PROCEDURES FOR EXISTING
CIVIL WORKS POWERHOUSES

TABLE OF CONTENTS

PARAGRAPH	PAGE
1 Purpose.....	1
2 Applicability	1
3 Distribution Statement	1
4 References.....	1
5 Background/Discussion	1
APPENDICES	
Appendix A	
References.....	A-1
A-1 Required Publications	A-1
A-2 Related Publications.....	A-2
Appendix B	
Seismic Evaluation Procedures for Existing Civil Works Powerhouses	B-1
B-1 Overview.....	B-1
a. General.....	B-1
(1) Purpose	
(2) Scope	
b. Background.....	B-2
(1) Basis of program	
(2) Powerhouse performance requirements	
c. Powerhouse evaluation process	B-2
(1) General	
(2) Evaluation procedures	
(3) Performance-based analysis	
(4) Limits on the use of linear procedures and DCR evaluations	
d. Evaluation process	B-4
(1) Field investigation	
(2) Performance-based analyses	
e. Analysis decision making process	B-6
(1) General	

PARAGRAPH	PAGE
(2) Actions based on the results of the field investigation	
(3) Selection of analysis method	
(4) Special analysis	
(5) Progressive analysis per Figure B-2 flowchart	
f. Reporting the findings.....	B-9
g. Qualifications of investigators	B-9
B-2 Design Criteria	B-9
a. Earthquake hazard levels	B-9
(1) General	
(2) BSE-2	
(3) BSE-1A	
b. Performance Levels	B-9
(1) General	
(2) LS performance level	
(3) IO performance level	
(4) CP performance level	
c. Performance Requirements	B-10
(1) General	
(2) Loading combinations	
d. Performance Evaluation.....	B-11
B-3 Estimating Earthquake Ground Motion Demands.....	B-11
a. Specification of earthquake ground motions	B-11
(1) General	
(2) Using response spectra to estimate earthquake demand	
b. Multi-directional effects.....	B-12
(1) General	
(2) Orthogonal combination method	
(3) SRSS and CQC methods	
c. Earthquake demands on inelastic systems	B-13
d. Interaction between bays in response to longitudinal direction demands.....	B-13
B-4 Methods of Seismic Analysis and Structural Modeling	B-13
a. Introduction.....	B-13
(1) General	
(2) Criteria	
b. Field investigation.....	B-14
c. Analytical models and amplification effects.....	B-15
(1) General	
(2) Superstructure-only models	
(3) Tributary mass assumptions	
(4) Mass for overhead crane, switchgear, and other roof attachments	
d. Effective stiffness.....	B-23
e. Damping.....	B-24

PARAGRAPH	PAGE
f. Linear static procedure (LSP) analysis	B-24
(1) Introduction	
(2) Simple-LSP analysis	
(3) LSP analysis	
g. Linear Dynamic Procedure (LDP) Analysis	B-34
h. Special Analysis.....	B-35
(1) Displacement ductility evaluation	
(2) Finite element analysis of composite substructure-superstructure system	
(3) Site-specific ground motion study	
(4) 3D analysis of superstructure	
i. Demand-to-capacity ratio evaluations	B-39
B-5 Force and Displacement Capacities.....	B-39
a. Introduction.....	B-39
b. Shear (diagonal tension)	B-41
c. Sliding shear.....	B-43
d. Reinforcing steel anchorage.....	B-43
e. Reinforcing steel splices and hooked bars	B-43
f. Fracture of reinforcing steel.....	B-44
g. Flexural strength	B-44
h. Displacement ductility capacity.....	B-44
(1) Curvature capacity	
(2) Rotational capacity	
(3) Displacement ductility capacity of cantilever structures	
(4) Estimating displacement ductility	
i. Loss of support for roof system and overhead crane	B-49
j. Substructure system components.....	B-50
B-6 Analysis Procedures and Evaluation of Seismic Analysis Results.....	B-50
a. Introduction.....	B-50
b. Seismic evaluation using the DCR method	B-50
(1) General	
(2) Flexural performance	
(3) Shear performance	
c. Displacement ductility evaluation.....	B-52
B-7 Reporting Findings from Field Inspection and Performance-Based Analyses.....	B-53
a. General.....	B-53
b. Field inspection reporting	B-53
(1) Field data collection trip	
(2) Field data collection checklist	
(3) True/false evaluation statements	
c. Final report	B-58

PARAGRAPH	PAGE
Appendix C	
Amplification Discussion.....	C-1
C-1 General.....	C-1
C-2 Discussion of Ebeling, Perez-Marcial, and Yule (2006)	C-3
C-3 Height-wise amplification	C-11
C-4 Resonance-related amplification.....	C-14
C-5 Amplification provisions contained in FEMA 356 (2000).....	C-14
C-6 Estimating the period of the substructure and superstructure.....	C-16
C-7 Estimating superstructure amplification effects.....	C-19
C-8 Amplification by time-history analysis.....	C-20
Appendix D	
Evaluating Older Powerhouses	D-1
D-1 General.....	D-1
D-2 FEMA 356 (2000) ductility demand classifications	D-2
D-3 FEMA 356 (2000) requirements for non-conforming splice and development lengths	D-2
a. Splice length requirements.....	D-2
b. Embedment length requirements	D-4
D-4 Splice and development length requirements for “low bond” deformation bars.....	D-4
D-5 Default values for use in LSP, LDP, and Special analyses.....	D-5
Appendix E	
Example	E-1
E-1 Introduction.....	E-1
E-2 Evaluation	E-2
E-3 Field data collection checklist.....	E-3
E-4 True/false checklist	E-3
E-5 Simple-LSP and LSP analyses.....	E-3
E-6 Standard response spectrum.....	E-3
E-7 Simple-LSP and LSP analyses for a transverse-direction earthquake	E-16
E-8 Simple-LSP and LSP analyses for a longitudinal-direction earthquake.....	E-30
E-9 Element capacities	E-34
E-10 Comparison of earthquake demands to element capacity.....	E-37
E-11 Conclusions based on LSP analysis.....	E-38
E-12 Linear dynamic procedure analysis	E-38
E-13 Special displacement ductility capacity evaluation	E-46
E-14 Seismic evaluation of connections.....	E-48
E-15 Conclusions.....	E-50
Appendix F	
Notation.....	F-1
